How does a mine storage support the energy system?

A mine storage supports the energy system in several ways, often simultaneously. It can act as energy storage, grid frequency regulator, capacity reserve, transmission support, inertia provider, or as a behind-the-meter solution to support large energy producers or energy-intensive industries.

Who is mine storage international?

Mine Storage International was founded by a group of energy experts and renewable energy investors who joined forces to enable the green energy transition.

How many households can a mine storage facility support?

An average mine storage can support 250 000 households when it is releasing energy. Read about our Swedish project that we are developing in Skåne. The Vångå mine storage facility will be able to deliver 25-50 GWh per year to the region and will therefore contribute to a more stable energy situation in southern Sweden.

Why should we store energy in mines?

Anna Engman, Co-Founder and CMO: "Storing energy in mines is a brilliant idea. The environmental impact of the mine has already taken place and with mine storage, the mine is given a new and sustainable purpose. We use water, which is the cleanest means of storage, and the most obvious force which is gravity.

Do coal mines need energy storage technologies?

Various energy storage technologies and risks in coal mine are analyzed. A significant percentage of renewable energy is connected to the grid but of the time-space imbalance of renewable energy, that raises the need for energy storage technologies.

What is a large-scale energy storage solution?

Their large-scale energy storage solution uses retired mines or quarries and turns them into circular energy storage facilities. The environmental impact of a mine storage facility is minimal thanks to using already existing infrastructure in a closed loop system.
