What is the exhaust system of a diesel generator set?

The definition of the exhaust system of a diesel generator set refers to the exhaust pipeline connected to the engine room by the engine exhaust port after the generator set is installed on the basis of the engine room.

What should I know about my generator's exhaust system?

The exhaust system is also an important part to be aware of on your generator's diagram. The exhaust fumes emitted by a generator are just like an exhaust from any other diesel engine - they contain highly toxic chemicals that need to be properly managed.

Who designs and installs a generator exhaust system?

The proper design and functionality of a generator exhaust system falls on the responsibility of the engineering firm of record. If a field fabricated system is being utilized, the design and installation of the system must be a collaboration between the engineering firm and the installing contractor.

Can a wet exhaust system cause a generator set failure?

A wet system is more complicated, because exhaust gases are cooled by water before they leave the boat. Plumbing a wet exhaust system incorrectly is a major cause of generator set failure (see Fig. 1). If you are a boatyard mechanic, the following tips will help to ensure the safe installation and operation of the wet exhaust system.

What are the requirements for a diesel generator exhaust outlet?

(8) The exhaust outlet of diesel generator set shall not bear heavy pressure, and all rigid pipelines shall be supported and fixed with the help of buildings or steel structures.

What temperature does a generator exhaust system emit?

Generator exhaust systems must also be engineered and properly installed to accommodate thermal expansion. Generator exhaust systems emit exhaust at temperatures anywhere from 500°F up to 1300°F depending on the unit size, manufacturer, and type of fuel burned.

Figure 1-2 gives the exhaust temperature at rated load. The engine exhaust mixes with the generator set cooling air at the exhaust end of the enclosure. Mount the generator set so that the hot exhaust does not blow on plants or other combustible materials. Maintain the clearances shown in the dimension drawing in Section 3. PAGE 14

Never operate the generator set without a muffler or with a faulty exhaust system. CAUTION Engine noise. Hazardous noise can cause hearing loss. Generator sets not equipped with sound enclosures can produce noise levels greater than 105 dBA. Prolonged exposure to noise levels greater than 85 dBA can cause permanent hearing loss. Wear hearing

Exhaust piping should not exert more than 37kg (60 pounds) of weight on the engine when the system is at operating temperature. Flexible connections are needed to relieve exhaust system components of vibrational fatigue. They can also prevent vibration transmission throughout the building and can accommodate misalignment problems at installation.
