How does a solar combiner work?

The output of several solar strings is combined by the combiner box. Each string conductor lands on a fuse terminal as the output of the fused inputs is combined onto a single wire that connects the box to the inverter.

The combiner box commonly houses the input overcurrent protection fuse assemblies for several strings (from as few as three strings to as many as 52), as well as the combined bus of those inputs into a single main output. Today's combiner box may also house several other components for the site, such as a DC disconnect, surge protective ...

Each can output 200Amps 240V. I need to combine both outputs into one which would result in 400Amps, via some kind of AC Combiner box, or bus, or multi blade switch, to then go to a distribution panel. I have no idea how to do this, or what to search for. Everything that uses breakers appears to be thousands of dollars.

The new PV AC Combiner boxes have been designed for PV systems with string inverters in trackers or fix tilt systems. The product portfolio is suitable for inverters from 60 kW up to 200 kW and support voltages of 400 V, 690 V or 800 V AC. The combiner boxes allow to collect from 2 up to 6 string inverters in one single cabinet.

The AC combiner box combines these outputs before sending power to the grid or central PV. Smart combiner box Equipped with advanced monitoring and communication capabilities, smart combiner boxes can track performance data for each connected string or panel, detect faults, and often provide remote diagnostic capabilities.

The working principle of combiner boxes is simple - they combine the DC output of multiple solar panels into a manageable circuit. This combined output is then fed to an inverter, which converts the DC power into usable alternating current ...

How many inputs and outputs does the photovoltaic AC combiner box have

This is a preference and may depend upon the site and application. If you have multiple outputs from the solar array, having a single combiner box at the array with a single output to the controller might be a cleaner solution; however, if you only have 1 or 2 outputs, it might make more sense to just combine them at the controller.
