Related Post: How to Design and Install a Solar PV System? Working of a Solar Cell. The sunlight is a group of photons having a finite amount of energy. For the generation of electricity by the cell, it must absorb the energy of the photon. The absorption depends on the energy of the photon and the band-gap energy of the solar semiconductor material and it is expressed in electron-volt (eV).

$N \text{ modules} = \text{Total size of the PV array (Wh)} / \text{Rating of selected panels in peak-watts}$ . Suppose, in our case the load is 3000 Wh/per day. To know the needed total W Peak of a solar panel capacity, we use PFG factor i.e.  $\text{Total W Peak of PV panel capacity} = 3000 / 3.2 \text{ (PFG)} = 931 \text{ W Peak}$ . Now, the required number of PV panels are  $= 931 / 160\text{W} = 5.8$ .
