

Microgrids are not fundamentally different from wide-area grids. They support smaller loads, serve fewer consumers, and are deployed over smaller areas. But microgrids and wide-area grids have the same job within the power generation eco-system, distributing electricity, and the same constraints, perfectly matching generation and load at all times.

Therefore, a consideration of PQ performance for any microgrid system is important where few microgrid testbeds have implemented power quality devices, as shown in the 147 E.
