

Microgrid storage cost breakdown in Greece 2030

Why is mini-grid LCOE so expensive?

Poor asset utilization, costly financing and regulatory barriers also drive up costs. 60% of mini-grid LCOE is due to upfront costs, among which 48% is from capital expense (CAPEX) and 12% from project development and installation. (RMI, p.18)

How can solar-hybrid mini-grid LCOE be reduced by 60%?

Solar-hybrid mini-grid LCOE can be reduced by 60% and reach US\$0.22/kWh by 2030 by leveraging hardware cost reduction, remote monitoring technology, system standardization, demand stimulation, low cost financing and minimizing regulatory barrier. "Six ways to reduce mini-grid costs by 60% for rural electrification".

How much does a mini-grid cost?

LCOE of US\$0.60/kWh needs to be more than halved to allow for an affordable cost-reflective tariff. Upfront cost per connection for mini-grids is around US\$500-2,100, similar to the unsubsidized cost for traditional grid connections. In remote areas, mini-grids are the preferred options for electrification as grid extension costs increase.

What are the different mini-grid cost metrics?

Understanding different mini-grid cost metrics supports informed decision-making. For instance, the levelized cost of energy (LCOE) accounts for all costs spread over the lifetime and load profile of a mini-grid, including capital expenses (CAPEX), operating expenses (OPEX) and therefore is an indicator for the cost-reflective tariff.

How can mini-grid reduce LCOE?

Reducing cost of capital by 4% can shave 5% off mini-grid's LCOE. (RMI, p.31) Minimizing regulatory barriers, such as through tax exemption and simplified permitting procedures, can unlock additional investment and reduce mini-grid costs by 5%. (RMI, p.31)

How many storage plants are there in Greece?

Currently there are four (4) storage plants operating in Greece, two open-loop pumped-hydro storage (PHS) stations in the mainland (700 MW in total) and two small hybrid RES-storage stations in non-interconnected islands (just 3 MW).
