Hydrogen is considered the primary energy source of the future. The best use of hydrogen is in microgrids that have renewable energy sources (RES). These sources have a small impact on the environment when it comes

to carbon dioxide (CO₂) emissions and a power generation cost close to that of conventional power plants. Therefore, it is important to study ...

The authors in (Guo et al., 2021) study the environmental and economic aspects of integrating demand response and EVs in the microgrids. In order to cut down on greenhouse gas emissions, the authors suggested a strategy for EV-based network based on the Shenzhen carbon comprehensive management strategies.

The objective of this paper is to demonstrate that controllable and islandable microgrids can help improve the resiliency of power grids in extreme conditions. Four ...

As microgrid types 1-4 (see above) feature mostly small-scale generation units close to the point of consumption, they enable the exploitation of abundant distributed renewable energy resources, e.g., solar or wind power, or local bio-based fuels (Murthy 2012) some cases, micro-hydropower can also be used (Soshinskaya et al. 2014, 662). The use of local ...
