

Nickel manganese cobalt battery supplier quotation in Bolivia 2030

Can battery manufacturers securing supply of essential battery raw materials by 2030?

Based on current market observations, battery manufacturers can expect challenges securing supply of several essential battery raw materials by 2030, McKinsey's report finds. Battery makers use more than 80% of all lithium that is mined today, and that share could grow to 95% by 2030.

Will manganese demand outpace the demand for battery-grade materials?

Meanwhile, the supply of manganese is projected to grow moderately through 2030, but an increasing demand for battery-grade material is likely to outpace supply, requiring the development of new refineries.

Will battery chemistry reduce cobalt reliance?

Although battery chemistry is evolving to reduce cobalt reliance, McKinsey forecasts a 7.5% annual increase in absolute cobalt demand until 2030. This growth highlights issues around sourcing transparency and price volatility, with companies prioritising ethical and sustainable practices in response.

What type of nickel is used in a battery?

Today, about 65% of class 1 nickel--a high-purity type essential for batteries--is used in stainless steel production. By 2030, the competition between the battery and steel sectors could lead to shortages.

Can high-purity manganese be used for battery use?

Despite being plentiful, the refinement of high-purity manganese into manganese sulphate monohydrate (HPMSM) for battery usage is complex and demands stringent control to eliminate impurities. McKinsey's production growth projections remain conservative with only a small fraction of demand anticipated to be met by 2030.

How much manganese sulfate is needed for a battery?

Under the base case, only about 20% of the HPMSM (high-purity manganese sulfate monohydrate) supply will meet the requirements of battery applications (30% if all announced projects are realized), which themselves will account for only about 5% of total demand for manganese.
