Inverter technology is the key technology to have reliable and safety grid interconnection operation of PV system. It is also required to generate high quality power to AC utility system with reasonable cost. To meet with these requirements, up to date technologies of power electronics are applied for PV inverters.

In the off-grid solar system, the correct startup sequence and shutdown sequence of the inverter are very important. Wrong operation may cause damage to the inverter. So, next I want to show you: About the startup sequence:

After entering operation, the inverter will monitor the output of the solar cell components at all times. As long as the output power of the solar cell components is greater than the output power required by the inverter, the inverter will continue to run; it will stop until sunset, even if it is cloudy or rainy. The inverter can also be operated.

The manual shutdown procedure can be a useful tool for solving errors and glitches that you're experiencing with your solar PV power system. Follow the guide below to power down your system (and switch it back on again).

Under no circumstances should the solar inverter be opened or unplugged. We recommend that your system is inspected by a Clean Energy Council Accredited Installer every two years. To ...

3). The inverter must be installed according to the instructions stated in this manual. 4). The system design must meet inverter specifications. To start-up the inverter, the Grid Supply Main Switch (AC) must be turned on, BEFORE the DC Switch is turned on. To stop the inverter, the Grid Supply Main Switch (AC) must be turned off
