For a solar PV plant to offer the maximum return on investment, each panel needs to be calibrated to absorb and convert solar energy at the highest efficiency level possible. Using a Solar IV Curve gives engineers the information they need to calibrate panels and achieve peak efficiency. The Solar IV Curve can also help identify issues with panels.

If you connect a solar panel to a high impedance load (hence expecting a very low current in the panel), modeling the solar panel as a imperfect voltage source (ie. with a series resistor) is certainly the most pertinent. ... Typically, the I-V characteristics curve is drawn at one sun radiation (1000 W/m^2) however, variation in solar radiation value predominantly changes the current output from the solar panel and subsequently the power output. The output voltage from solar panel is highly dependent on the operating temperature of the solar cells.
