

One of the technical challenges with the recovery of valuable materials from end-of-life (EOL) photovoltaic (PV) modules for recycling is the liberation and separation of the materials.

DOI: 10.1016/j.resconrec.2023.106922 Corpus ID: 256889251; Prospective life cycle assessment of recycling systems for spent photovoltaic panels by combined application of physical separation technologies

end-of-life (EOL) photovoltaic (PV) modules for recycling is the liberation and separation of the materials. We present a potential method to liberate and separate shredded EOL PV panels for the recovery of Si wafer particles. The backing material is removed by submersion in liquid nitrogen, while the encapsulant is removed by pyrolysis.

Thermal and hydrometallurgical processes are prevalent in most of the PV recycling methods, and the encapsulating material can be removed with the aid of thermal decomposition and nitric acid [1]. Jung et al. [2] used a thermal treatment to decompose the EVA layer and to separate the different layers of solar panels. Doi et al. [3] used various organic ...

As panels end their usable lifetime, panel waste will pile up. There are three broad types of solar panel recycling: re-use, mechanical, and chemical/thermal. Solar recycling is far more advanced in Europe than in the U.S. - primarily due to overseas policy structures that require manufacturers to recycle their panels.

The global cumulative capacity of PV panels reached 270 GW in 2015 and is expected to rise to 1630 GW by 2030 and 4500 GW by 2050, with projections indicating further increases over time [19].

Comparison of different treatment methods of discarded photovoltaic solar panel. Past and recent studies on valorization of wastes under plasma pyrolysis process. Figures - uploaded by Ndungutse ...

photovoltaic panel is composed of frames, a junction box, glass, encapsulant, a back sheet, and a photovoltaic cell, which consists of a Si substrate and Cu, Ag, and Al electrodes. Because photovoltaic panels contain valuable resources, recycling of the panels is required. Recycling technologies for photovoltaic panel have been developing in ...

there were around 250,000 metric tonnes of solar panel waste globally [12]. ... Physical separation . In this process, panels are primarily dismantled by removing the .

With the rapid increase of photovoltaic (PV) system production and installation, the recycling of end-of-life PV modules has become an important issue. In this paper, the recovery of Si by separating the layers of

end-of-life PV modules using KOH-ethanol solution was investigated. Compared with traditional swelling or dissolving reagents (such as benzene and ...

Overall, these results suggest that a combination of high-voltage pulse crushing and physical separation is a promising approach for recycling photovoltaic panels. Furthermore, processing costs in the high-voltage pulse crushing were estimated to be 0.21 JPY/W (about 0.0019 USD/W), which shows potential for commercial viability.

The PV industry in Mexico is modest, but in the last year, Mexico appears among the countries with the fastest growth in the installed capacity of photovoltaic panels in America, behind the USA and Brazil. Nowadays, many panels are being installed and the outlook is that soon the installed capacity will grow exponentially [1,21]. In Mexico, the ...

In order to increase the worldwide installed PV capacity, solar photovoltaic systems must become more efficient, reliable, cost-competitive and responsive to the current demands of the market.

Thermal delamination - meaning the removal of polymers from the module structure by a thermal process - as a first step in the recycling of crystalline silicon (c-Si) photovoltaic (PV) modules in order to enable the subsequent recovery of secondary raw materials was investigated.

High-voltage pulse crushing technology combined with sieving and dense medium separation was applied to a photovoltaic panel for selective separation and recovery of materials. The panel was first separated into glass and back sheet layers by high-voltage pulse crushing through microexplosions or shock waves transmitted in the Al electrode and Si ...

Up to now several authors carried out research related to PV panels recycling. Fernandez et al. [8] examined the possibility of silicon solar cells recycling by insulating them into cement-based systems. Chemical studies about silicon recovery from PV panels were also carried out by using acid/alkaline agents as well as organic solvents for EVA degradation and/or ...

As the use of photovoltaic installations becomes extensive, it is necessary to look for recycling processes that mitigate the environmental impact of damaged or end-of-life photovoltaic panels. There is no single path for recycling silicon panels, some works focus on recovering the reusable silicon wafers, others recover the silicon and metals contained in the ...

The design of an optimal system for recycling photovoltaic panels is a pressing issue. This study performed a prospective life cycle assessment using experimental and pilot data to reveal the ...

The physical separation of PV panel modules begins with the removal of the aluminum frame and junction box. Afterward, silicon can be commercialized, and the modules can be shredded into small parts and crushed

into fine particles. Subsequently, solar cells, polymers, cell stringing ribbons, and glass can be separated using sifting and eddy ...

The received EOL solar panels used in the current study. The procedure was performed in several stages: firstly, a physical treatment was conducted to achieve the beneficiation and concentration of valuable materials in specific fractions; secondly, chemical leaching was conducted in different steps to achieve the dissolution of the required materials; and finally, the ...

Prospective life cycle assessment of recycling systems for spent photovoltaic panels by combined application of physical separation technologies Author links open overlay panel Aya Heiho a, Izuru Suwa b, Yi Dou c, Soowon Lim d e, Takao Namihira f, Taketoshi Koita d, Kazuhiro Mochidzuki g, Shinsuke Murakami h, Ichiro Daigo i, Chiharu Tokoro d j, ...

Recycling of polycrystalline silicon, amorphous silicon and CdTe photovoltaic panels was investigated by studying two alternative routes made up of physical operations: ...

Abstract Solar energy has emerged as a prominent contender in this arena, attracting significant attention across the globe. Governments worldwide have undertaken extensive efforts to encourage the adoption of renewable energy, increasing the usage of solar panels. Despite its benefits, the deployment of photovoltaic (PV) modules generates significant ...

The method incorporated in recycling Si-based PV panels is to separate the layers, which necessitates removing the encapsulant from the panel and the Si cells to recover the metals [23]. The removal of the encapsulant from the laminated structure is not straightforward and many possible approaches exist, including thermal, mechanical, and chemical process.

High-voltage pulse crushing technology combined with sieving and dense medium separation was applied to a photovoltaic panel for selective separation and recovery of materials. The panel was first separated into glass and back sheet layers by high-voltage pulse crushing through microexplosions or shock waves transmitted in the Al electrode and ...
