compromise between achieving a high current and high voltage, or, equivalently, between minimizing the transmission and thermalization losses.

A solar cell or photovoltaic cell (PV cell) is an electronic device that converts the energy of light directly into electricity by means of the photovoltaic effect. [1] It is a form of photoelectric cell, a device whose electrical characteristics (such as current, voltage, or resistance) vary when it is exposed to light. Individual solar cell devices are often the electrical building blocks of ...

The crystalline silicon solar cell is first-generation technology and entered the world in 1954. Twenty-six years after crystalline silicon, the thin-film solar cell came into existence, which is second-generation technology. And the last, the third-generation solar cell, is still emerging technology and not fully commercialized.

In comparison, the working principle of this solar cell is quite different from perovskite solar cells and inorganic p-n junction solar cells. When OPVs are illuminated, a localized and strongly bound exciton (i.e. a bound electron-hole pair) is generated, with the electron in the LUMO (lowest unoccupied molecular orbital) and the hole in the HOMO ...
