Overall, the perspectives for the future contribution of solar energy to the global energy mix are very high, as one example the possible development of solar electricity from solar thermal power plants according to the roadmap of the International Energy Agency shown in Fig. 2, with about 11% of contribution to electricity supply.

Solar thermal power plants are electricity generation plants that utilize energy from the Sun to heat a fluid to a high temperature. This fluid then transfers its heat to water, which then becomes superheated steam. This steam is then used to turn turbines in a power plant, and this mechanical energy is converted into electricity by a generator. This type of generation is essentially the ...
