Which direction should solar panels be installed?

"Solar PV (photovoltaic) panels generate electricity from sunlight and will normally be installed on the roof of the building facing in the most south direction. The panels should also face as much south as possible. If you faced east, or west, then expect a yield of around 20% less generation annually," explains David Hilton.

How do you install solar panels in your yard?

The type of soil in your yard can dictate the best foundation option. A set of vertical aluminum pipes are installed onto the foundation, followed by the rails. The solar panels are then placed directly onto the structure. Ground mount solar mounting. Source: Wanhos Solar. Once the solar panels are installed, the system needs to be activated.

Suppose, in our case the load is 3000 Wh/per day. To know the needed total W Peak of a solar panel capacity, we use PFG factor i.e. Total W Peak of PV panel capacity = $3000 / 3.2$ (PFG) = 931 W Peak. Now, the required number of PV panels are = $931 / 160W = 5.8$. This way, we need 6 numbers of solar panels each rated for 160W.

As the three PV cells are connected in series, the generated output current (I) will be the same (assuming the cells are evenly matched). The total output voltage, V_T will be the sum of all the individual cell voltages added together. That is: $V_1 + V_2 + V_3 = 0.5V + 0.5V + 0.5V = 1.5V$. Then the solar cell I-V characteristic curves of our three cells example are simply added ...
