What is a phase regulated in a microgrid?

The phase of the inverter voltage is regulated to control the active power output of the inverter. The basic idea behind this strategy is proposed in [1]. The inverter interface with the microgrid can be modeled according to $P_{gen} = V_i V_t \sin(\theta)$ (10) where V_i is the voltage synthesized at the inverter bus,

What is a microgrid control strategy?

The proposed control strategy is based on the use of a phase locked loop to measure the microgrid frequency at the inverter terminals, and to facilitate regulation of the inverter phase relative to the microgrid. This control strategy allows microgrids to seamlessly transition between grid-connected and autonomous operation, and vice versa.

What is phase-locked loop synchronization?

Typically, phase-locked loop (PLL) synchronization techniques are used for the grid voltage monitoring. The design and performance of PLL directly affect the dynamics of the RES grid side converter (GSC).

What is a phase locked loop?

The phase locked loop generates an angle (θ) corresponding to the load phase angle which is calculated by the Eq. (1) to obtain the desired system frequency (f). The f in Hz, and the phase angle is in radian. The angle plays a vital role in the load frequency control of a standalone microgrid system.

What is a phase-locked loop (PLL)?

The proposed control scheme uses a phase-locked loop (PLL) to establish the microgrid frequency at the inverter terminals, and to provide a phase reference that is local to the inverter. The proposed controller has been tested extensively in simulation and hardware.
