CONVENTIONAL SOLAR POWER --mostly based on silicon--is already a green energy success, supplying roughly 3% of all electricity on the planet. It's the biggest new source of power being added to the grid, with more than 200 gigawatts coming online annually, enough to power 150 million homes. ... Thin, light, and flexible, organic solar cells ...

The light-absorbing material is thin and flexible enough to apply to the surface of almost any building or common object. Oxford's technique, which stacks multiple light-absorbing layers into one solar cell, will be utilized to connect a wider range of the light spectrum, allowing more power to be generated from the same amount of sunlight.

These panels are made up of ultra-thin silicon cells, typically just a few micrometers wide, sandwiched between layers of protective plastic. This thin-film technology allows for flexibility and versatility, making them ideal for various ...
