What is a microgrid?

A microgrid is a group of interconnected loads and distributed energy resources that acts as a single controllable entity with respect to the grid. This learning path will provide an understanding about microgrid technologies.

What is a microgrid & why should you care?

Microgrids are small-scale power systems that have the potential to revolutionize the way we generate, store, and distribute energy. They offer a flexible and scalable solution that can provide communities and businesses with a more reliable, efficient, and sustainable source of energy.

How do microgrids manage energy?

Energy Management: Microgrids need a system to manage the flow of energy, ensuring that energy is being used efficiently and effectively. This includes monitoring and controlling the mix of energy sources, as well as balancing the energy supply and demand.

What are the components of a microgrid?

They can be used to power individual homes, small communities, or entire neighborhoods, and can be customized to meet specific energy requirements. Microgrids typically consist of four main components: energy generation, energy storage, loads and energy management. The architecture of microgrid is given in Figure 1.

What is the mix of energy sources in a microgrid?

The mix of energy sources depends on the specific energy needs and requirements of the microgrid. Energy Storage: Energy storage systems, such as batteries, are an important component of microgrids, allowing energy to be stored for times when it is not being generated.

How can microgrids contribute to a low carbon future?

Microgrids play a crucial role in the transition towards a low carbon future. By incorporating renewable energy sources, energy storage systems, and advanced control systems, microgrids help to reduce dependence on fossil fuels and promote the use of clean and sustainable energy sources.

In this paper, a new discrete-time data-driven distributed learning control strategy for frequency/voltage regulation and active/reactive power sharing of islanded microgrids is proposed.
